TOTAL IT SOLUTIONS

Overview

A "static IP" refers to a fixed Internet Protocol (IP) address that doesn't change over time.¹ It's the opposite of a "dynamic IP address," which is temporarily assigned and can change each time a device connects to the internet or after a certain period

Steps to set a static IP address in Windows

1. Open Network Settings:

- Click on the Start button and type settings in search bar and select "Settings" (gear icon).
- Go to "Network & internet".
- Select your network connection (Ethernet or Wi-Fi).

2. Edit IP Settings:

- Next to "IP assignment," click "Edit".
- Change the IP assignment method from "Automatic (DHCP)" to "Manual".
- Toggle on "IPv4".

3. Manually Configure IP Settings:

- Enter the desired static IP address, subnet mask, default gateway, and preferred/alternate DNS server addresses.
- Click "Save".
